

NEW VIEW ROOFING + EMBER BOTS

A practical case for **recovering** **missed revenue.**

New View Roofing appears to have the market credibility, service quality, and local trust. The business case for Ember Bots is making sure the revenue path behind that brand is just as strong: fast response, clean scheduling, consistent follow-up, and less admin drag.

AND TIGHTEN

Core thesis

New View may not need more demand as badly as it needs better monetization of demand it already earns.

- Roofing jobs are high-value and timing-sensitive.
- Storm, leak, and insurance inquiries often go to multiple competitors.
- The first credible responder usually has an advantage.
- Manual follow-up and coordination quietly leak revenue.

Where revenue likely leaks before the job is won

In roofing, revenue leakage usually does not look dramatic. It looks like normal operating friction: a missed call, a delayed form response, a prospect waiting on scheduling, an estimate with no structured follow-up, or a customer stuck in insurance coordination.

LEAD RESPONSE

Slow first contact

A 24-hour response promise may be operationally reasonable, but it is weak for urgent storm and leak inquiries.

CALL CAPTURE

After-hours leakage

Phone-heavy service categories lose revenue when missed calls are not automatically captured and re-engaged.

SCHEDULING

Inspection friction

Every delay between inquiry and booked inspection increases the risk that another contractor wins the opportunity.

FOLLOW-UP

Quote decay

Good inspections can still go cold if estimate follow-up depends entirely on rep memory or manual discipline.

INSURANCE

Admin drag

Claims create repetitive communication, document requests, next-step reminders, and internal coordination work.

VISIBILITY

Hidden stalled revenue

Without clean daily visibility, stuck opportunities often stay invisible until they are already lost.

The strongest pitch is not “AI.” It is revenue recovery.

Ember Bots should position the opportunity around faster response, better inspection conversion, stronger estimate follow-up, and less operational drag — not generic automation language.

Simple financial case

The exact numbers should be validated in discovery. But the directional economics are strong because roofing jobs are high-value and response/follow-up improvements do not need to be massive to matter.

SCENARIO	MONTHLY LIFT	ANNUAL IMPACT
Conservative Recover 2 otherwise-lost jobs/month at \$12,000 average job value.	\$24,000 added monthly revenue	\$288,000 potential annual revenue lift
Moderate Recover 4 otherwise-lost jobs/month through faster response and tighter follow-up.	\$48,000 added monthly revenue	\$576,000 potential annual revenue lift
Capacity Reclaim 30 hours/month of admin and coordination work.	\$1,050–\$1,500 monthly capacity value	\$12,600–\$18,000 annual operating capacity

What Ember would implement

- Instant SMS/email lead acknowledgment
- Missed-call text-back and after-hours capture
- Inspection booking, reminders, and rescheduling flows
- Estimate follow-up and dormant lead reactivation
- Insurance-process reminders and task handoffs
- Daily pipeline summaries and stuck-opportunity alerts

Why it pays back

- Each recovered job has meaningful dollar value.
- Speed-to-lead improves the chance of booking the inspection.
- Structured follow-up protects already-earned opportunities.
- Admin automation gives project managers more time for sales and service.
- Visibility reduces the chance that good leads quietly die.

Recommended commercial path

STEP 1

Missed Revenue Snapshot

Audit lead response, missed-call handling, inspection scheduling, estimate follow-up, and insurance workflow drag.

STEP 2

Lead Recovery + Response System

Deploy the highest-ROI fixes first: instant response, routing, missed-call recovery, scheduling, and follow-up.

STEP 3

Operational Coordination System

Expand into insurance coordination, internal task orchestration, daily summaries, and stalled-opportunity reporting.

FINAL POSITIONING

New View already appears to have the brand trust. Ember Bots helps make sure the operating system behind it converts.

Best sales line

“You already generate trust and demand. The question is how much revenue is quietly being lost between first contact, inspection booking, estimate follow-up, and claim coordination.”

Bottom line

New View Roofing is a strong-fit target because it combines high-ticket local service work, urgent inbound demand, and repeatable operational friction. Ember Bots should lead with a practical business case: recover missed revenue, book more inspections, protect estimate follow-up, and reduce admin drag without replacing the human relationship that wins roofing jobs.
